Title: Tic Tac Toe game implementation using Magic Square (Heuristic Method)

Objective: To write a computer program in such a way that computer wins most of the time

Theory: It is two players, X and O, game who take turns marking the spaces in a 3×3 grid. The player who succeeds in placing three respective marks in a horizontal, vertical, or diagonal row wins the game.

1	2	3
4	5	6
7	8	9

Algorithm:

Approach 1: Brute Force

- a) Consider a Board having nine elements vector.
- b) Each element will contain
 - i) 0 for blank
 - ii) 1 indicating X player move
 - iii) 2 indicating O player move
- c) Computer may play as X or O player.
- d) First player who so ever is always plays X.

- 2) MT is a vector of 3^9 elements, each element of which is a nine element vector representing board position.
- 3) MT is a vector of 3^9 elements, each element of which is a nine element vector representing board position.
 - a) Move Table (MT) is a vector of 39 elements, each element of which is a nine element vector representing board position.

Index	Current Board position	New Board position
0	000000000	000010000
1	000000001	020000001
2	000000002	000100002
3	000000010	002000010
⋮		

- b) To make a move, do the following:
 - a. View the vector (board) as a ternary number and convert it to its corresponding decimal number.
 - b. Use the computed number as an index into the MT and access the vector stored there.
 - i. The selected vector represents the way the board will look after the move.
 - c. Set board equal to that vector.

Approach 2: MINMAX

- 1) Board: A nine-element vector representing the board: B[1..9]
- 2) Following conventions are used
 - (a) 2 - indicates blank
 - (b) 3 - X
 - (c) 5 - 0

Turn: An integer

(d) 1 - First move

(e) 9 - Last move

Make_2 → tries to make valid 2

Make_2 first tries to play in the center if free and returns 5 (square number). If not possible, then it tries the various suitable non corners square and returns square number.

Go(n) ← makes a move in square 'n' which is blank represented by 2.

PossWin (P) → Returns 0, if player P cannot win in its next move, otherwise the number of square that constitutes a winning move for P.

Rule: If *PossWin (P)* = 0 {P cannot win} then find whether opponent can win. If so, then block it.

- 2) Move 1: go (5)
- 3) Move 2: If B[5] is blank, then Go(5) else Go(1)
- 4) Move 3: If B[9] is blank, then Go(9) else Go(3) {*make 2*}
- 5) Move 4: {*By now human (playing X) has played 2 chances*} If *PossWin(X)* then {*block H*} Go(*PossWin(X)*) else Go (*Make_2*)
- 6) Move 5: {*By now computer has played 2 chances*} If *PossWin(X)* then {*won*} Go(*PossWin(X)*) else {*block H*} if *PossWin(O)* then Go(*PossWin(O)*) else if B[7] is blank then Go(7) else Go(3)
- 7) Move 6: {*By now both have played 2 chances*} If *PossWin(O)* then {*won*} Go(*PossWin(O)*) else {*block H*} if *PossWin(X)* then Go(*PossWin(X)*) else Go(*Make_2*)
- 8) Moves 7 & 9 : {*By now human (playing O) has played 3 chances*} If *PossWin(X)* then {*won*} Go(*PossWin(X)*) else {*block H*} if *PossWin(O)* then Go(*PossWin(O)*) else Go(Anywhere)
- 9) Move 8: {*By now computer has played 3 chances*} If *PossWin(O)* then {*won*} Go(*PossWin(O)*) else {*block H*} if *PossWin(X)* then Go(*PossWin(X)*) else Go(Anywhere)

Approach 3: Heuristic Function

- 1) Same as approach 2 except for one change in the representation of the board.
 - a) Board is considered to be a magic square of size 3 X 3 with 9 blocks numbered by numbers indicated by magic square.
- 2) This representation makes process of checking for a possible win simpler.
- 3) Board Layout as magic square. Each row, column and diagonals add to 15.

8	3	4	15
1	5	9	15
6	7	2	15

- 4) Maintain the list of each player's blocks in which he has played.
 - a) Consider each pair of blocks that player owns.
 - b) Compute difference D between 15 and the sum of the two blocks.
 - c) If $D < 0$ or $D > 9$ then
 - i) these two blocks are not collinear and so can be ignored
 - ii) Otherwise if the block representing difference is blank (i.e., not in either list) then a move in that block will produce a win.

Output:

```
[2]
[' ', ' ', ' ']
[' ', ' ', ' ']
[' ', ' ', 'X']
Enter position for 'O' 1
[' ', ' ', ' ']
[' ', ' ', ' ']
['O', ' ', 'X']
[2, 4]
[' ', ' ', 'X']
[' ', ' ', ' ']
['O', ' ', 'X']
Enter position for 'O' 6
[' ', ' ', 'X']
[' ', ' ', 'O']
['O', ' ', 'X']
[2, 4, 8]
['X', ' ', 'X']
[' ', ' ', 'O']
['O', ' ', 'X']
Enter position for 'O' 8
['X', 'O', 'X']
[' ', ' ', 'O']
['O', ' ', 'X']
['X', 'O', 'X']
[' ', 'X', 'O']
['O', ' ', 'X']
Machine is the winner
```

```

[4]
[' ', ' ', 'X']
[' ', ' ', ' ']
[' ', ' ', ' ']
Enter position for 'O' 5
[' ', ' ', 'X']
[' ', 'O', ' ']
[' ', ' ', ' ']
[4, 6]
[' ', ' ', 'X']
[' ', 'O', ' ']
['X', ' ', ' ']
Enter position for 'O' 3
[' ', ' ', 'X']
[' ', 'O', ' ']
['X', ' ', 'O']
['X', ' ', 'X']
[' ', 'O', ' ']
['X', ' ', 'O']
[1, 3, 7, 9]
Enter position for 'O' 8
['X', 'O', 'X']
[' ', 'O', ' ']
['X', ' ', 'O']
['X', 'O', 'X']
['X', 'O', ' ']
['X', ' ', 'O']
Machine is the winner

```

Post Lab Assignment:

1. What is the easiest trick to win Tic Tac Toe?
2. What is the algorithm to follow to win a 5*5 Tic Tac Toe?
3. Is there a way to never lose at Tic-Tac-Toe?
4. What can tic-tac-toe help you with?
